

SHA-512 HASHING ALGORITHM

The SHA-512 (Secure Hash Algorithm 512-bit) is a cryptographic hash function that takes an input message and produces a 512-bit (64-byte) hash value. It is commonly used for data integrity verification and password storage.

Functions:

1. `right_rotate(n: int, bits: int) -> int`
 - Purpose: Rotates an integer right by a given number of bits.
 - Parameters:
 - `n``: The integer to rotate.
 - `bits``: The number of bits to rotate.
 - Returns: The rotated integer.
2. `sha512(message: str) -> str`
 - Purpose: Computes the SHA-512 hash of a given message.
 - Parameters:
 - `message`: The input message as a string.
 - Returns: The SHA-512 hash as a hexadecimal string.

Class: SHA512Hasher

This class encapsulates the SHA-512 hashing process, making it convenient to compute the hash of input messages while hiding the underlying implementation details.

Methods:

1. `__init__(self)`
 - Initializes the SHA-512 hasher with initial hash values and constants.
2. `right_rotate(self, n: int, bits: int) -> int`
 - Rotates an integer right by a given number of bits.
3. `padding_msg(self, message: bytes) -> bytes`
 - Pads the input message to a length multiple of 128 bytes.
4. `divide_into_blocks(self, padded_msg: bytes) -> List[bytes]`
 - Divides the padded message into 128-byte blocks.
5. `sigma_0(self, x: int) -> int`
 - SHA-512 Sigma function 0.

6. `sigma_1(self, x: int) -> int`
 - SHA-512 Sigma function 1.
7. `ch(self, e: int, f: int, g: int) -> int`
 - SHA-512 choice function.
8. `maj(self, a: int, b: int, c: int) -> int`
 - SHA-512 majority function.
9. `a_summation(self, a: int) -> int`
 - SHA-512 summation function for A.
10. `e_summation(self, e: int) -> int`
 - SHA-512 summation function for E.
11. `compute(self, message: bytes) -> str`
 - Computes the SHA-512 hash of the given message.
 - Parameters:
 - message: The input message as bytes.
 - Returns: The SHA-512 hash as a hexadecimal string.
12. `sha512(self, message: str) -> str`
 - Computes the SHA-512 hash of a message using the SHA-512 algorithm.
 - Parameters:
 - message: The input message as a string.
 - Returns: The SHA-512 hash as a hexadecimal string.

This documentation provides an overview of the SHA-512 hashing algorithm, its functions, and the `SHA512Hasher` class that encapsulates the algorithm.
